## Verification

## Problem 1: Intersection of Büchi Automata [4 Points]

Provide NBA  $\mathcal{A}_1$  and  $\mathcal{A}_2$  for the languages given by the expressions  $(AC+B)^*B^\omega$  and  $(B^*AC)^\omega$  and apply the product construction (using GNBA) to obtain an NBA  $\mathcal{A}$  with  $\mathcal{L}_\omega(\mathcal{A}) = \mathcal{L}_\omega(\mathcal{A}_1) \cap \mathcal{L}_\omega(\mathcal{A}_2)$ .

Justify, why  $\mathcal{L}_{\omega}(\mathcal{G}) = \emptyset$  where  $\mathcal{G}$  denotes the GNBA accepting the intersection.

## Problem 2: Fairness [2 Points]

Consider the transition system TS shown in Figure 1 with the set of atomic propositions  $\{a\}$ .

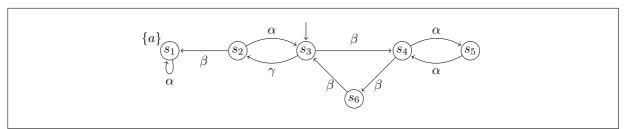

Figure 1: Transition system TS

Let the fairness assumption

$$\mathcal{F} = (\emptyset, \{\{\alpha\}, \{\beta\}\}, \{\{\beta\}\})$$

determine whether  $TS \models_{\mathcal{F}}$  "eventually a". Justify your answer!

The following exercises belong to the afternoon session.

## Problem 3: Model Checking with SPIN [10 Points]

Program TRY-MUX1 of Figure 2 is suggested as a tentative solution to the mutual exclusion problem. For this exercise we will use the Model Checker SPIN (http://spinroot.com) to automatically verify some of last week's properties. For now, use assertions appropriately to verify the presence of path or the absence of a path in the system.

(a) Implement TRY-MUX1 in Promela. Check basic functionality using simulation runs and printf-statements. [4 Points]

```
| \begin{array}{c} \textbf{local} \ y_1, y_2 : \textbf{integer where} \quad y_1 = 0, y_2 = 0 \\ \\ P_1 :: \begin{bmatrix} l_0 : \textbf{loop forever do} \\ \begin{bmatrix} l_1 : \textbf{noncritical} \\ l_2 : \textbf{wait until} \ y_2 = 0 \\ l_3 : y_1 := 1 \\ l_4 : \textbf{critical} \\ l_5 : y_1 := 0 \end{bmatrix} \bigg| \quad | P_2 :: \begin{bmatrix} m_0 : \textbf{loop forever do} \\ \begin{bmatrix} m_1 : \textbf{noncritical} \\ m_2 : \textbf{wait until} \ y_1 = 0 \\ m_3 : y_2 := 1 \\ m_4 : \textbf{critical} \\ m_5 : y_2 := 0 \\ \end{bmatrix} \bigg|
```

Figure 2: Program TRY-MUX1: proposed solution.

- (b) Verify that both critical regions are accessible, i.e. that there exist paths to the critical regions of P1 and P2. [1 Point]
- (c) Verify the mutual exclusion property. [2 Point]
- (d) Answer questions (b) and (c) for a modified version of the program, TRY-MUX2, in which statements  $l_2$  and  $l_3$  are interchanged and so are statements  $m_2$  and  $m_3$ . [3 Points]

Be prepared to demo your verification runs in the morning discussion slot on tuesday, either on your own laptop or by sending us all necessary files.
